

11 The rate of an enzyme-catalysed reaction changes as substrate concentration changes.

Which row correctly describes how the rate changes, and gives the correct reason why it changes in this way?

	how the rate changes as substrate concentration increases	why the rate changes in this way
A	the rate increases initially and subsequently decreases	activation energy is lowered, but cannot go below a particular minimum value
B	the rate increases initially and subsequently decreases	all enzyme active sites are occupied at high substrate concentrations
C	the rate increases, eventually reaching a maximum value	activation energy is lowered, but cannot go below a particular minimum value
D	the rate increases, eventually reaching a maximum value	all enzyme active sites are occupied at high substrate concentrations
