

- 15** Two students are each given equal volumes of 0.1 mol dm^{-3} silver nitrate, sodium ethanoate and potassium bromide.

The first student mixes sodium ethanoate and silver nitrate and obtains a white precipitate. On adding potassium bromide to this mixture, the white precipitate dissolves and a cream precipitate forms.

The second student adds the silver nitrate to the potassium bromide and obtains a cream precipitate. On adding the sodium ethanoate to this mixture there is no further change.

Which statements explain these observations?

- 1 Silver ethanoate is insoluble.
- 2 Silver bromide is less soluble than silver ethanoate.
- 3 Ethanoate can oxidise bromide.

A 1, 2 and 3 **B** 1 and 2 only **C** 2 and 3 only **D** 1 only
