

- 3 The table shows the boiling points of two organic compounds.

compound	boiling point / °C
CH ₃ Cl	-24
CH ₃ Br	+4

Which statement explains the relative boiling points of CH₃Cl and CH₃Br?

- A Chlorine is more electronegative than bromine.
- B There are hydrogen bonds between CH₃Cl molecules but not between CH₃Br molecules.
- C Bromine atoms contain more electrons than chlorine atoms.
- D The covalent bonds are stronger in CH₃Br than in CH₃Cl.
