

- 30 A current of 0.65 A is passed through 250 cm³ of 0.200 mol dm⁻³ copper(II) sulfate. The anode and cathode of the electrolytic cell are both made of platinum.

How long will it take for the concentration of the copper(II) sulfate to fall to 0.100 mol dm⁻³?

- A $\frac{250 \times 0.100 \times 9.65 \times 10^4}{1000 \times 0.650}$ min
- B $\frac{250 \times 0.100 \times 2 \times 9.65 \times 10^4}{63.5 \times 0.650}$ min
- C $\frac{250 \times 0.100 \times 2 \times 9.65 \times 10^4}{1000 \times 0.650}$ s
- D $\frac{250 \times 0.100 \times 9.65 \times 10^4}{63.5 \times 1000 \times 0.650}$ s
