

- 24 Ethylamine, $\text{C}_2\text{H}_5\text{NH}_2$, and diethylamine, $(\text{C}_2\text{H}_5)_2\text{NH}$, both behave as Lewis bases in the gas phase.

Which row correctly identifies:

- which equilibrium position lies further to the right,
- one reason for the relative positions of the two equilibria?

	the equilibrium position that lies further to the right	one reason for the relative positions
A	equilibrium 1	electron-withdrawing effect of alkyl groups
B	equilibrium 1	electron-donating effect of alkyl groups
C	equilibrium 2	electron-withdrawing effect of alkyl groups
D	equilibrium 2	electron-donating effect of alkyl groups
