

- 4 The table shows the boiling points of three alkanes.

	boiling point/°C
pentane	36
2-methylbutane	28
2,2-dimethylpropane	10

What is responsible for the differences in boiling points?

- A different number of carbon-carbon bonds
- B different relative molecular masses
- C weaker hydrogen bonding between branched chain molecules
- D stronger induced dipole attractions between straight chain molecules
