

- 5 Equimolar amounts of the liquids trichloromethane, CHCl_3 , and propanone, CH_3COCH_3 , are mixed together at 20°C . The original intermolecular forces are disrupted and stronger intermolecular forces (between CHCl_3 and CH_3COCH_3) are made simultaneously.

The boiling point of trichloromethane is 61°C . The boiling point of propanone is 56°C .

Which row is correct?

	initial temperature of mixture	boiling point of mixture
A	above 20°C	above 61°C
B	below 20°C	above 61°C
C	above 20°C	below 56°C
D	below 20°C	below 56°C
