

16 Which statement about propene explains how it reacts with bromine?

- A** Electrons in the carbon–carbon π bond are donated to an electrophile.
- B** Electrons in the carbon–carbon σ bond are donated to an electrophile.
- C** The sp^2 hybridised carbon is an electrophile and accepts a pair of electrons.
- D** The σ bond between the sp^2 hybridised carbon atoms is weak and readily broken.
