

21 Amines react with acids in the gas phase to form salts.

Which row correctly describes both the order of the gas phase relative basic strengths of primary, secondary and tertiary amines, and the possible reason for this order?

	relative basic strengths (> is stronger than)	reason
A	tertiary > secondary > primary	alkyl groups are electron-donating
B	tertiary > secondary > primary	alkyl groups have greater steric effect
C	primary > secondary > tertiary	alkyl groups are electron-donating
D	primary > secondary > tertiary	alkyl groups have greater steric effect
