

26 When a standard copper electrode is joined to a standard hydrogen electrode, the $E_{\text{cell}}^{\ominus} = +0.34 \text{ V}$.

Which change to the cell conditions leads to a higher cell potential?

- A** decreasing the pressure of the hydrogen gas of the hydrogen electrode
- B** increasing the hydrogen ion concentration of the hydrogen electrode
- C** using 1.0 mol dm^{-3} copper(II) nitrate solution instead of copper(II) sulfate solution
- D** using 1.0 mol dm^{-3} ethanoic acid instead of hydrochloric acid in the hydrogen electrode
