

- 7** [Assume that at sea level one fifth of the air is oxygen and that the pressure is 1 bar.]

Deep-sea divers use tanks containing a mixture of oxygen gas and helium gas. A diver inhales the gas mixture at 4 bar from the tank.

Whilst diving, a diver inhales oxygen gas at the same partial pressure that oxygen gas is inhaled from the air at sea level.

What is the percentage of oxygen in the tank?

- A** 0.05% **B** 0.8% **C** 5% **D** 20%
