

2 In the interhalogen compound BrCl , there is a single polar covalent bond.

Which statement helps to explain the polarity of the $\text{Br}-\text{Cl}$ covalent bond?

- A** Br is more electronegative than Cl.
- B** The outer shell electronic configuration of both elements is s^2p^5 .
- C** The outer shell electrons are more shielded from the nuclear charge in Br than they are in Cl.
- D** The repulsion between electrons in the outer shell is greater in Br than it is in Cl.
